

City of Columbia's Arborist Disclaimer Statement

Arborists are tree specialists who use their education, knowledge, training, and experience to examine trees, assess their condition, and recommend measures to enhance the beauty and health of trees, while attempting to reduce risk.

Arborists cannot detect every condition that could possibly lead to the failure of a tree. Trees are living organisms that fail in ways that cannot always be predicted. Conditions are often hidden within trees and below ground, and can develop quickly after an inspection. Arborists cannot guarantee that a tree will be healthy or safe under all circumstances, or for a specified period of time. Likewise remedial treatments cannot be guaranteed.

The data collected included the tree number, species, diameter, condition rating, management needs, comments, dollar value, and risk rating for each tree. This survey was confined to the designated subject tree(s), within the boundaries of Stadium, Providence, and Broadway. The Davey Tree Expert survey was performed in the interest of facts of the tree(s) without prejudice to or for any other service or any interested party.

The data collected by Davey Tree Expert has not been checked for accuracy by the City of Columbia. The City of Columbia will verify data prior to any work to be performed.

Tree Inventory Glossary

DBH

Diameter is measured in inches at 4-1/2 feet above the ground, or diameter-breast-height (DBH).

Condition

In general, the health and structure of each tree will be recorded in one of the following categories based on visible root, trunk, scaffold branch, twig, and foliage conditions at the time of the inventory and adapted from the rating system established by the International Society of Arboriculture and based on visible root, trunk, scaffold branch, twig, and foliage conditions at the time of the inventory:

1. Excellent. 100% condition rating.
2. Very Good. 90% condition rating.
3. Good. 80% condition rating.
4. Fair. 60% condition rating.
5. Poor. 40% condition rating.
6. Critical. 20% condition rating.
7. Dead. 0% condition rating

Primary Maintenance Need

The following primary maintenance needs will be determined based on ANSI A300 standard specifications:

1. **Removal** - Trees designated for removal have defects that cannot be cost effectively or practically treated. The majority of the trees in this category have a large percentage of dead crown. All trees with safety risks that could be seen as potential threats to persons or property and seen as potential liabilities to the client would be in this category. This category includes large dead and dying trees that are high-liability risks as well as those that pose minimal liability to persons or property (such as trees in poor locations or undesirable species).
2. **Large Tree Clean** - These trees require selective removal of dead, dying, broken, and/or diseased wood to minimize potential risk. Priority of work should be dependent upon the Risk associated with the individual trees. Trees in this category may be large enough to require bucket truck access or manual climbing.
3. **Small Tree Clean** - These trees require selective removal of dead, dying, broken, and/or diseased wood to minimize potential risk. Priority of work should be dependent upon the Risk associated with the individual trees. These trees are small-growing, mature trees that can be evaluated and pruned from the ground.
4. **Young Tree Train** - These are young trees that must be pruned to correct or eliminate weak, interfering, or objectionable branches in order to minimize future maintenance requirements. Generally, these trees may be up to 20 feet in height and can be worked with a pole pruner by a person standing on the ground.
5. **Stump Removal** - This category indicates a stump that should be removed. Lacking specific information on stump removal required by local code requirements per the client.
6. **Plant Tree** - During the inventory, vacant planting sites will be identified by street, address, and site number. The size of the site is designated as small, medium, or large (indicating the ultimate size that the tree will attain), depending on the growing space available and the presence of overhead wires. Lacking local code definitions, planting sites are determined based on standard specifications set forth in accepted technical journals and by the arboriculture industry

Risk Assessment

A risk rating will be assigned using an assessment protocol based on the USDA Forest Service Community Tree Risk Rating System.

1. Probability of Failure (1–4 points). Identifies the most likely failure and rates the likelihood that the structural defect(s) will result in failure based on observed, current conditions.

a) Low: some minor defects present.

- minor branch/crown dieback
- minor defects or wounds

b) Moderate: several moderate defects present

- stem decay or cavity within safe shell limits: shell thickness >1 inch of sound wood for each 6 inches of stem diameter
- crack(s) without extensive decay
- defect(s) affecting 30–40% of the tree's circumference
- crown damage/breakage: hardwoods up to 50%; pines up to 30%
- weak branch union: major branch or codominant stem has included bark
- stem girdling roots: <40% tree's circumference with compressed wood
- root damage: <40% of roots damaged within the critical root radius

c) High: multiple of significant defects present:

- stem decay or cavity at or exceeding shell safety limits: minimum shell thickness = 1 inch of sound wood for each 6 inches of stem diameter
- cracks, particularly those in contact with the soil or associated with other defects
- defect(s) affecting >40% of the tree's circumference
- crown damage/breakage: hardwoods >50%; pines >30%
- weak branch union with crack or decay
- girdling roots with >40% of tree's circumference with compressed wood
- root damage: >40% of roots damaged within the critical root radius
- leaning tree with recent root breakage or soil mounding, crack or extensive decay
- dead tree: standing dead without other significant defects

d) Extremely High: multiple and significant defects present; visual obstruction of traffic signs/lights or intersections:

- stem decay or cavity exceeding shell safety limits and severe crack
- cracks: when a stem or branch is split in half or has cracks on opposite sides
- defect(s) affecting >40% of tree's circumference or critical root radius and extensive decay or crack(s)
- weak branch union with crack and decay
- leaning tree with recent root breakage or soil mounding and crack or extensive decay
- dead branches: broken (hangers) or with a crack
- dead trees: standing dead with other defects, such as cracks, hangers, extensive decay, or major root damage
- visual obstruction of traffic signs/lights or intersections
- physical obstruction of pedestrian or vehicle traffic

2. Size of Defective Part (1–3 points). Rates the size of the part most likely to fail. If the trunk is the part most likely to fail, tree will be recommended for removal and the DBH value will be used for the size of the defective part.

- a) Parts less than 4 inches in diameter
- b) Parts from 4 to 20 inches in diameter
- c) Parts greater than 20 inches in diameter

3. Probability of Target Impact (1–3 points). Rates the use and occupancy of the area that would be struck by defective part.

- a) Occasional Use: low-use roads and park trails; parking lots adjacent to low-use areas; natural areas such as woods or riparian zones; transition areas with limited public use; industrial areas.
- b) Intermediate Use: moderate- to low-use school playgrounds, parks, and picnic areas; parking lots adjacent to moderate-use areas; secondary roads (neighborhoods) and park trails within moderate- to high-use areas; and dispersed campgrounds.
- c) Frequent Use: emergency access routes, medical and emergency facilities and shelters, and handicap access areas; high-use school playgrounds, parks, and picnic areas; bus stops; visitor centers, shelters, and park administrative buildings and residences; main thoroughfares and congested intersections in high-use areas; parking lots adjacent to high-use areas; interpretive signs, kiosks; scenic vistas; and campsites (particularly drive-in).

4. Other Risk Factors (0–2 points). This optional subjective risk rating is used if professional judgment suggests the need to increase the total risk rating and invoke immediate corrective action. For example, trees with a numeric risk rating of 9 or 10 would be identified as high-priority trees to receive corrective treatments first. An inspector may wish to increase a tree's risk rating from 8 to 9 as a means of ensuring the tree will receive immediate corrective treatment. The total risk rating should not exceed 10 points.

Risk Rating

Generally, trees with the highest numeric risk ratings should receive corrective treatment first. The overall risk rating of the tree will be indicated, based on the sum of above risk assessment field values. See the formula below:

Risk Rating (3–10 points) = probability of failure (1–4 points) + size of defective part (1–3 points) + probability of target impact (1–3 points) + optional subjective risk rating (0–2 points)

Trees assessed as lower risk may fail before trees assessed as higher risk. There are many uncontrollable conditions, such as weather, pests, and human involvement, that can contribute to tree failure. Davey's assigned risk is meant only to be used as a guideline to make safety-driven maintenance decisions and to direct normal tree maintenance programs efficiently. All risk ratings are based on observable defects at the time of assessment. All observations are made from the ground. The following risk ratings will be assigned:

1. None. *Numeric Risk Rating* equals 0. Used for planting and stump sites only.
2. Low. *Numeric Risk Rating* equals 3 or 4. Trees designated as presenting a Low risk have minor visible structural defects or wounds in areas with moderate to low public access. At the current time, the observable defects—using visual inspection—do not meet the threshold of failure. No corrective action is required.
3. Moderate. *Numeric Risk Rating* equals 5 or 6. Trees designated as presenting a Moderate risk have defects that may be cost-effectively or practically treated. The majority of trees in this category exhibit several moderate defects affecting <40% of a tree's trunk, crown, or critical root zone. This

category may also include young or newly planted trees in frequent public use areas, such as downtown business districts or popular parks. At the current time, the observable defects—using visual inspection—do not meet the threshold of failure. The defects may or may not result in eventual tree failure. These trees can be recommended for pruning or removal and should be addressed after all *Severe* and *High* risk tree maintenance.

4. High. Numeric *Risk Rating* equals 7 or 8. Trees designated as presenting a High risk have defects that cannot be cost-effectively or practically treated. The majority of the trees in this category have multiple or significant defects affecting >40% of the trunk, crown, or critical root zone. Defective trees and/or tree parts are most likely between 4–20 inches in diameter and can be found in areas of frequent occupation, such as a main thoroughfare, congested streets, and/or near schools. Currently, these defects indicate that the tree is failing, is in immediate danger of failing, or has already partially failed. These trees can be recommended for pruning or removal and should be addressed immediately after all *Severe* risk removals.
5. Severe. Numeric *Risk Rating* equals 9 or 10. Trees designated as presenting a Severe risk have defects that cannot be cost-effectively or practically treated. The majority of the trees in this category have multiple and significant defects present in the trunk, crown, or critical root zone. Defective trees and/or tree parts are most likely larger than 20 inches in diameter and can be found in areas of frequent occupation, such as a main thoroughfare, congested streets, and/or near schools. Currently these defects indicate that the tree is failing, is in immediate danger of failing, or has already partially failed. Large dead and dying trees that are high liability risks are included in this category. This category is reserved for the highest priority removals only and corrective action should be taken as soon as possible.
